Scope of Work

1. Scope of works

The development will focus on the following.

Stage 1: Mathematical modeling, validation and parameter estimation of the underwater vehicle under submerged condition

- Compute resistance of the specified underwater vehicle over a defined range of forward speeds and generate a power requirement vs speed curve. Conduct straight-line resistance simulations at three speeds (Low, nominal and high) to support power estimation and verify the consistency of the CFD setup.
- Selection of thruster and deriving its characteristics/operating envelopes in the installed configuration (self-propulsion and open water). If the propulsion unit is not available to suit the underwater vehicle requirements, the contractor may propose a customized propeller design.
- Validate the CFD methodology using a benchmarking approach for demonstrating the correctness of the modeling approach.
- Validate the methodology using a benchmarking approach for estimating the hydrodynamic coefficients and verifying the mathematical model in a modular and traceable manner. This methodology shall identify the manoeuvres, comparisons and criteria used to demonstrate the model fidelity.
- Hydrodynamic coefficients (added mass, damping and control derivatives) have to be estimated through appropriate CFD simulations. These coefficients

fficients shall be used in mathematical model-based simulations to predict the AUV's response by numerically solving its kinematics and dynamics under control inputs.

- Develop a six-degree-of-freedom (6-DOF) mathematical model of the underwater vehicle using the hydrodynamic coefficients under submerged conditions.

Stage 2: Simulation-based evaluation and trajectory prediction

Two classes of simulations shall be used to evaluate the vehicle's behavior.

- CFD-based simulations to observe response under actuated control surfaces or defined environmental forces.
- Model-based simulations using the mathematical model derived in Stage 1 to evaluate controllability and response to commanded trajectories.
- Compare the relevant dynamic responses (Trajectories, velocities or other quantities such as forces as applicable) to assess the adequacy of the mathematical model for control design.

Stage 3: Controller design for speed, depth and heading regulation using the validated mathematical model developed in stage 1 and 2

- Design and tuning of PD/PID controller parameters and gain schedules for surge, pitch, and yaw using the validated mathematical model.
- Demonstrate controller performance through simulations carried out on the mathematical model under submerged operating conditions.
- Provide controller configuration data, including gains, schedules, limits and relevant tuning parameters.
